

## Assignment 3

### Overview of SQL

1) Does ANSI recognize the data type DATE?

ANSI (American National Standards Institute) does recognize the DATE data type.

- It's part of the standard SQL data types.
- DATE is used to store date values (like '2025-04-10'), without time information.

2) Which subdivision of SQL is used to insert values in tables?

The subdivision is DML - Data Manipulation Language.

- It includes commands like:
  1. INSERT (to add rows)
  2. UPDATE (to modify rows)
  3. DELETE (to remove rows)
  4. SELECT (to retrieve data)

So to insert values into a table, you'd use:

INSERT INTO TableName (column1, column2) VALUES (value1, value2);
